

Conference Call Reviewing Data Presented During the 2021 American Society of Nephrology (ASN) Meeting

November 4, 2021

Disclaimer

This Presentation contains forward-looking statements and information of Talaris Therapeutics, Inc. (“Talaris,” “we,” “our,”) within the meaning of the Private Securities Litigation Reform Act of 1995. All statements other than statements of historical facts contained in this Presentation, including statements regarding our strategy, future financial condition, future operations, projected costs, prospects, plans, objectives of management and expected market growth, are forward-looking statements. In some cases, you can identify forward-looking statements by terminology such as “may,” “will,” “should,” “expect,” “intend,” “plan,” “anticipate,” “believe,” “estimate,” “target,” “seek,” “predict,” “potential,” “continue” or the negative of these terms or other comparable terminology. Although we believe that the expectations reflected in these forward-looking statements are reasonable, these statements relate to our strategy, future operations, future financial position, future revenue, projected costs, prospects, plans, objectives of management and expected market growth, and involve known and unknown risks, uncertainties and other factors that may cause our actual results, levels of activity, performance or achievements to be materially different from any future results, levels of activity, performance or achievements expressed or implied by these forward-looking statements. Forward-looking statements in this presentation include, but are not limited to, statements about: the initiation, timing, progress, results and cost of manufacturing and conducting clinical trials of FCR001, as well as our research and development programs and our current and future preclinical and clinical studies, including statements regarding the timing of initiation and completion of studies or trials and related preparatory work, the period during which the results of the trials will become available, and our current and future programs; our ability to identify research priorities and apply a risk-mitigated strategy to efficiently discover and develop additional product candidates; our ability to initiate, recruit and enroll patients in and conduct our clinical trials at the pace that we project; our ability to scale-up our manufacturing and processing approaches to appropriately address our anticipated commercial needs, if FCR001 is approved; obtain and maintain regulatory approval of our product candidates, and any related restrictions, limitations or warnings in the label of any of our product candidates, if approved; our ability to compete with companies currently marketing or engaged in the development of treatments that our product candidates are designed to target; our reliance on third parties to conduct our clinical trials and to manufacture drug substance for use in our clinical trials; the size and growth potential of the markets for any of our current product candidates or other product candidates we may identify and pursue, and our ability to serve those markets; our ability to identify and advance through clinical development any additional product candidates; the commercialization of our current product candidates and any other product candidates we may identify and pursue, if approved, including our ability to successfully build a specialty sales force and commercial infrastructure to market our current product candidates and any other product candidates we may identify and pursue; the scope of protections we are able to establish and maintain for intellectual property rights covering our product candidates and our Facilitated Allo-HSCT Therapy; our ability to retain and recruit key personnel; our expectations regarding government and third-party payor coverage and reimbursement; our estimates of our expenses, ongoing losses, capital requirements and our needs for or ability to obtain additional financing; our expected uses of the net proceeds to us from this offering; the potential benefits of strategic collaboration agreements, our ability to enter into strategic collaborations or arrangements, and our ability to attract collaborators with development, regulatory and commercialization expertise; our financial performance; developments and projections relating to our competitors or our industry; the effect of the COVID-19 pandemic, including mitigation efforts and economic effects, on any of the foregoing or other aspects of our business operations, including but not limited to our preclinical studies and future clinical trials. We caution the Recipient not to place considerable reliance on the forward-looking statements contained in this presentation. The forward-looking statements in this presentation speak only as of the date of this document, and we undertake no obligation to update or revise any of these statements. Our business is subject to substantial risks and uncertainties, including those referenced above.

Any forward-looking statements are based on management’s current expectations and beliefs and are subject to a number of risks, uncertainties and important factors that may cause actual events or results to differ materially from those expressed or implied by any forward-looking statements contained in this press release, including, without limitation, risks associated with the impact of COVID-19 where the Company has operations or does business, as well as on the timing and anticipated timing and results of its clinical trials; the risk that the strategy and future operations of the Company, including the expected timing, enrollment, and results from FREEDOM-1 will not meet expectations; the risk that early data from the FREEDOM-1 study may not be predictive of or consistent with final results; the risk that the results of Talaris’ earlier clinical trials may not be predictive of future results in connection with future clinical trials; and the risk that the Company may not be able to successfully demonstrate the safety and efficacy of its drug candidates, including FCR001. These and other risks and uncertainties are described in greater detail in the section entitled “Risk Factors” in the Company’s Quarterly Report on Form 10-Q for the quarter ended June 30, 2021, as well as any subsequent filings with the Securities and Exchange Commission. In addition, any forward-looking statements represent Talaris’ views only as of today and should not be relied upon as representing our views as of any subsequent date. Talaris explicitly disclaims any obligation to update any forward-looking statements. No representations or warranties (expressed or implied) are made about the accuracy of any such forward-looking statements. Certain information contained in this Presentation relates to or is based on studies, publications, surveys and other data obtained from third-party sources and the Company’s own internal estimates and research. While the Company believes these third-party sources to be reliable as of the date of this Presentation, it has not independently verified, and makes no representation as to the adequacy, fairness, accuracy or completeness of, any information obtained from third-party sources. In addition, all of the market data included in this Presentation involves a number of assumptions and limitations, and there can be no guarantee as to the accuracy or reliability of such assumptions. Finally, while we believe our own internal research is reliable, such research has not been verified by any independent source.

Agenda

- Welcome and Introduction
- Top Line Results
 - Phase 3 initial data
 - Phase 2 long-term follow-up
 - Potential predictive urinary biomarker
- Q&A
- Conclusion

Talaris at a Glance

Novel, single-dose, investigational cell therapy with potential to transform standard of care in solid organ transplantation and multiple severe immune and non-malignant blood disorders

- **Lead product, FCR001, in Phase 3 to induce durable immune tolerance in living donor kidney transplant (LDKT) recipients**
 - Compelling Phase 2 data
 - Open label Phase 3 design mirrors optimized Phase 2; Orphan drug and RMAT designation from FDA
 - Highly predictive, near-term surrogate marker of long-term success identified in Phase 2
 - First clinical update November 4, 2021
- **FCR001 has pipeline-in-a-product potential across multiple therapeutic applications**
 - Large market opportunity
 - Initiated Phase 2 FREEDOM-2 study in October; additional Phase 2 study in autoimmune disease initiating 4Q 2021
 - Additional indications being investigated
- **Robust, reproducible and fully in-house manufacturing**
- **Strong IP position and high barriers to entry**
- **Well-financed; over \$265M cash on hand as of June 30, 2021**

Our Pipeline

* Open IND permits us to move directly into Phase 2 based on existing FCR001 safety data

** Organ transplant population estimates based on UNOS/OPTN data; scleroderma estimates derived from epidemiology and third party market research; LDKT Delayed Tolerance Induction patient numbers based on 1 year to 18 months delayed from incident LDKT; Scleroderma estimated point prevalence of diffuse cutaneous SSc patients with early, rapidly progressing disease and internal organ involvement

Nobel Prize 1960*

Allogeneic Tolerance and Chimerism

Goal: facilitate allogeneic tolerance by establishing durable chimerism

Allogenic tolerance: An approach to enable donor HSCs to coexist with recipient HSCs in the recipient's bone marrow ("chimerism"), and mature into mutually-tolerated, functional immune cells and blood cells

*Nobel Prize in Physiology or Medicine 1960 was awarded jointly to Sir Frank Macfarlane Burnet and Peter Brian Medawar 'for discovery of acquired immunological tolerance.'
The Nobel Prize in Physiology or Medicine 1960. NobelPrize.org. Nobel Media AB 2021. Tue. 16 Mar 2021.

Facilitating Immune Tolerance

Multiple Potential Applications

Reprogram

Solid Organ
Transplantation

Prevent organ rejection and the need for a lifelong, daily regimen of chronic drugs by reprogramming the transplant recipient's immune system.

Restore

Severe Auto-Immune
Disease

Treat autoimmune diseases by restoring the body's immune system to produce cells that are potentially capable of attacking "self".

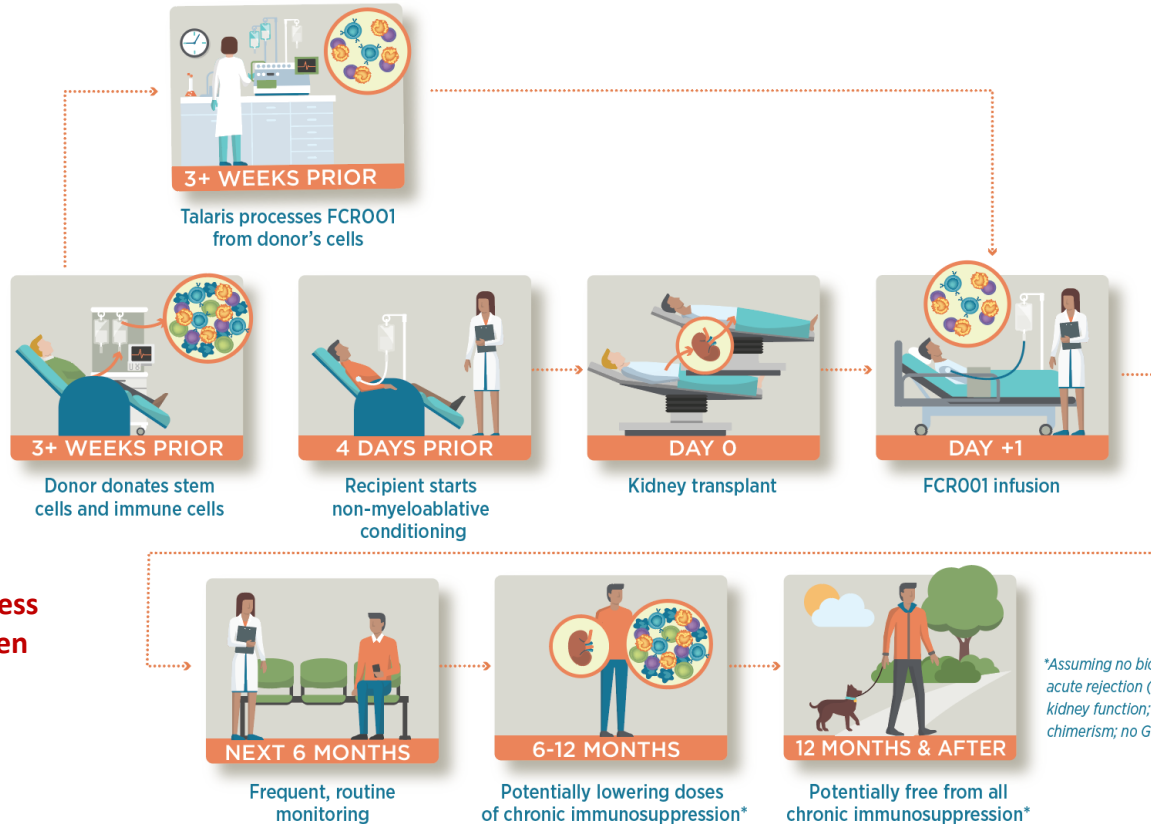

Replace

Severe Non-Malignant
Blood, Immune, and
Metabolic Disorders

Treat disorders caused by diseased immune or blood cells by replacing them with healthy cells, without the need for myeloablative conditioning

FCR001: The Donor-Recipient Journey

Our “vein to vein” process and protocols have been fully proceduralized

Highlights from Our Phase 2 Study (+ Long Term Follow Up)*

37 adult living donor kidney transplant (LDKT) patients were dosed with FCR001 at two leading US transplant sites between 2009 - 2016

70%

(26 OF 37) OFF
ALL IMMUNOSUPPRESSION
THERAPIES**

- Across all HLA-mismatches
- 82% success rate (14 of last 17) once key parameters were optimized

100%

TAKEN OFF
IMMUNOSUPPRESSION
REMAIN IS-FREE

- Median follow up: >6 yrs
- Longest follow up: >12 yrs

7/7

TOLERIZED PATIENTS WITH
PRIOR KIDNEY AUTO-IMMUNE
CONDITION HAD NO
RECURRENCE

- Recurrence ordinarily seen in 20% - 60% of patients***

* Data as October 1, 2021. Includes 33 patients under Phase 2 protocol and 4 compassionate use patients

** One year after transplant

*** Kienzl-Wagner 2018, Lim 2019, Moroni 2019

In Phase 2, Three and Six-Month Chimerism Were Highly Predictive of Durable Immune Tolerance

Values are mean +/- standard deviation. N indicates the number of FCR001 treated patients weaned off IS at approximately one year post-transplant for whom % whole blood and T-cell donor chimerism were measured at that time point

- “Chimerism”
 - % of recipient’s T-cells that are donor-derived
 - Simple blood test, measured at multiple time points
- **26/29 patients** (90%) who achieved chimerism at **month 3** were able to be weaned off chronic immunosuppression (IS)
- **26/27 patients** (96%) who achieved chimerism at **month 6** were able to be weaned off chronic IS
- **Every patient** weaned off chronic IS by **month 12** has remained off chronic IS for full duration of follow up
 - Median follow up >6 years
 - Longest follow up >12 years

Initial Phase 3 Clinical Data

FREEDOM-1 Phase 3 Registration Study

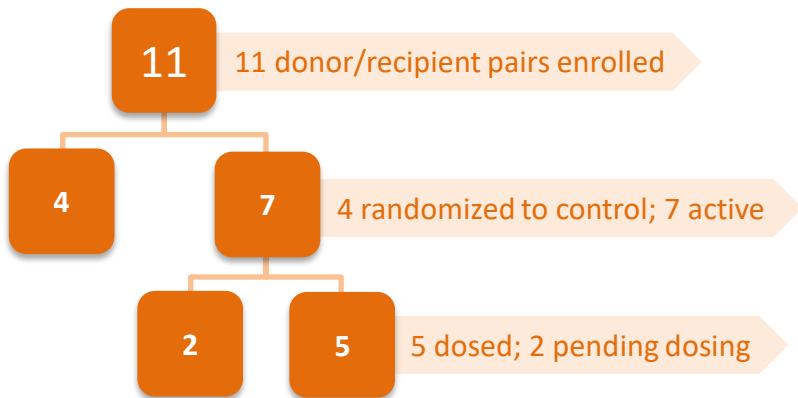

| STUDY OVERVIEW | |
|---|--|
| Study Design | <ul style="list-style-type: none">• Open-label, randomized, controlled, parallel group study of FCR001 in 120 first time, adult living donor kidney transplant (LDKT) recipients, randomized 2:1 between FCR001 : standard of care (SoC)• Five-year follow up for safety |
| Protocol; inclusion / exclusion criteria | <ul style="list-style-type: none">• Near-identical to optimized Phase 2 protocol |
| Primary Endpoint | <ul style="list-style-type: none">• Proportion of FCR001 recipients who are free from chronic immunosuppression, without biopsy proven acute rejection (BPAR), at Month 24 post-transplant |
| Key Secondary Endpoint | <ul style="list-style-type: none">• In FCR001 recipients only, no meaningful decline in renal function from post-transplant baseline (Month 1) to Month 24 |
| Additional Endpoints | <ul style="list-style-type: none">• Chimerism, kidney function, safety |
| Sites / Territory | <ul style="list-style-type: none">• Targeting ~18-20 sites in U.S. (14 active sites as of October 1, 2021) |

- **Neither primary nor key secondary endpoint involves statistical comparison to the SoC patients**

Enrollment, Demographics and HLA-matching

Enrollment and Demographics

- The 11 donor/recipient pairs have been enrolled at 5 different clinical sites
- All donors and recipients were between 18 – 65 years of age and met study eligibility criteria

HLA Mismatching Data

Clinical Update on First Phase 3 Patients

Status of first five patient dosed with FCR001:

| Time Since Kidney Transplant | | | | | |
|------------------------------|---|--|------|-------|------------|
| # of pts | <3mo | >3mo | >6mo | >12mo | >12/off IS |
| 2 | Chimeric* at 3, 6 and 12mo timepoints & removed from IS | | | | |
| 1 | Chimeric* at 3 and 6 mo timepoints | | | | |
| 2 | NM | <i>Not measured; patient has not reached 3mo timepoint</i> | | | |
| 5 | | | | | |

- **First two FCR001 subjects >12 months since transplant are off all chronic IS**
 - Both have maintained stable kidney function since being discontinued from chronic IS
 - Longest follow up: 15 months

Safety Profile Appears Consistent with Phase 2

- **Summary of BPAR and DSA data in all FCR-001 patients***
 - No instances of BPAR
 - No patients have developed donor-specific antibodies (DSA)

- **Summary of safety profile in FCR001 patients***
 - AEs and SAEs observed are consistent with those generally expected with kidney and stem cell transplantation involving non-myeloablative conditioning, and with what was observed in the Phase 2 study.
 - No events occurred to cause the Data Safety Monitoring Board (DSMB) to stop the study or modify the study protocol
 - No trial stopping rule was triggered

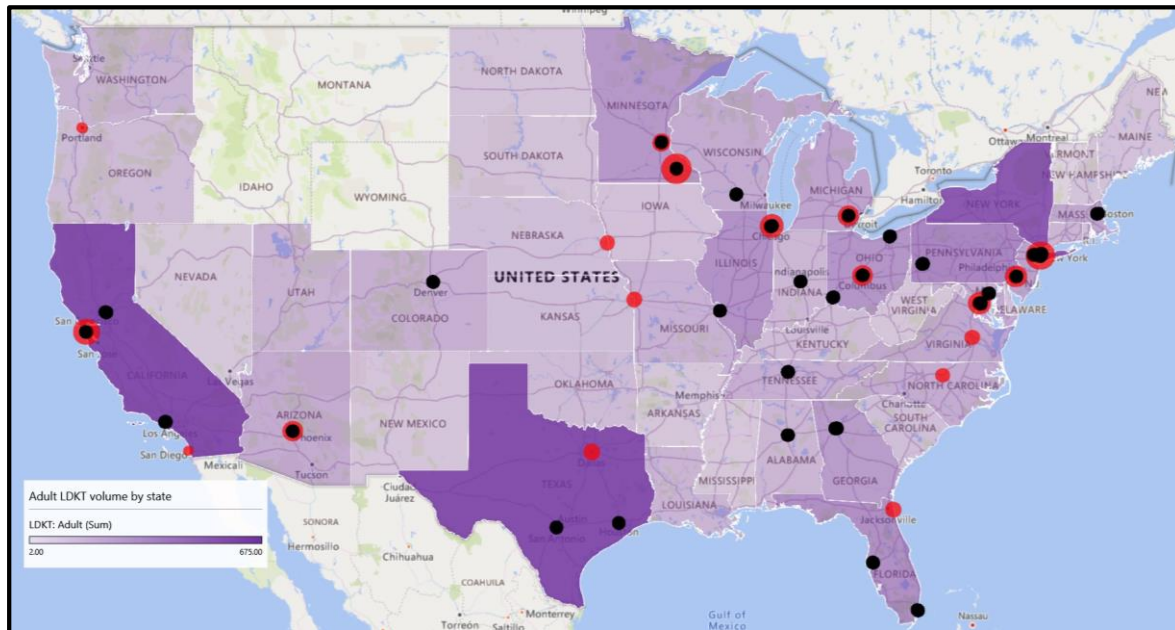

** Through the October 1, 2021, data cutoff date*

Potential to Extend Across Solid Organ Transplant

Reprogram

35 centers (16% of total) perform 50% of all US LDKT procedures

- Highest volume LDKT centers
- Current or proposed FREEDOM-1 sites (circle size proportional to LDKT volume)

Phase 2 Long-Term Follow-Up

Long-Term Follow-Up of Phase 2 Patients*

- All Phase 2 patients weaned off chronic IS have continued to remain off chronic IS for the duration of their follow-up, without rejecting their donated kidney and without DSA
- Median follow up >6 years; longest follow up >12 years.
- Six Phase 2 LDKT recipients have now exceeded 10 years off all chronic IS
- Since last update, there has been one patient death that the DSMB deemed to be unrelated to FCR001. As previously reported, this patient was not tolerized, remained on IS, and had lost their graft 47 months post-transplant
- Cumulative total of more than 250 patient-years of exposure to FCR001 in the Phase 2 LDKT recipients.
- Most adverse events in the Phase 2 study occurred during the first 12 months post-transplant when the patients were on conventional immunosuppression

* Through the October 1, 2021, data cutoff date

Urinary mRNA Profiling

Potential New Signal of Immune Quiescence

- **Summary.** In a subset of FCR001 patients in the Phase 2 study, Talaris identified a potential mRNA signature of immune quiescence in the FCR001-tolerized patients
- **Method.** Using urinary cell mRNA profiling, urine samples from a subset of tolerized Phase 2 FCR001 patients were compared to those from biopsy-matched, non-study LDKT patients on standard of care chronic immunosuppression
- **Results.** The FCR001 patients assessed in the study exhibited a differentiated mRNA signature from the biopsy-matched, non-study LDKT patients. This signature featured increased levels of CTLA4 mRNA and significantly higher ratios of CTLA4 to both granzyme B and perforin. The higher ratios of CTLA4 to granzyme B and perforin in the FCR001-tolerized patients may indicate a greater degree of immune quiescence in the FCR001-tolerized patients than in the biopsy-matched, standard of care kidney transplant recipients
- **Conclusion.** These data support the hypothesis that the FCR001 patients have been tolerized to their donated kidney

Potential to Extend Across Solid Organ Transplant

Living Donor Kidney Transplant Delayed Tolerance Induction

FREEDOM.2

- Phase 2 study initiated October 2021
- **Goal:** Safely induce durable tolerance and eliminate immunosuppression in **prior recipients of LDKT** (those transplanted 3 – 12 months prior to FCR001 administration)
- Potential to expand market to prevalent LDKT population

Potential US Market Opportunity:
~6,000 – 10,000* /yr

Deceased Donor Kidney Transplant

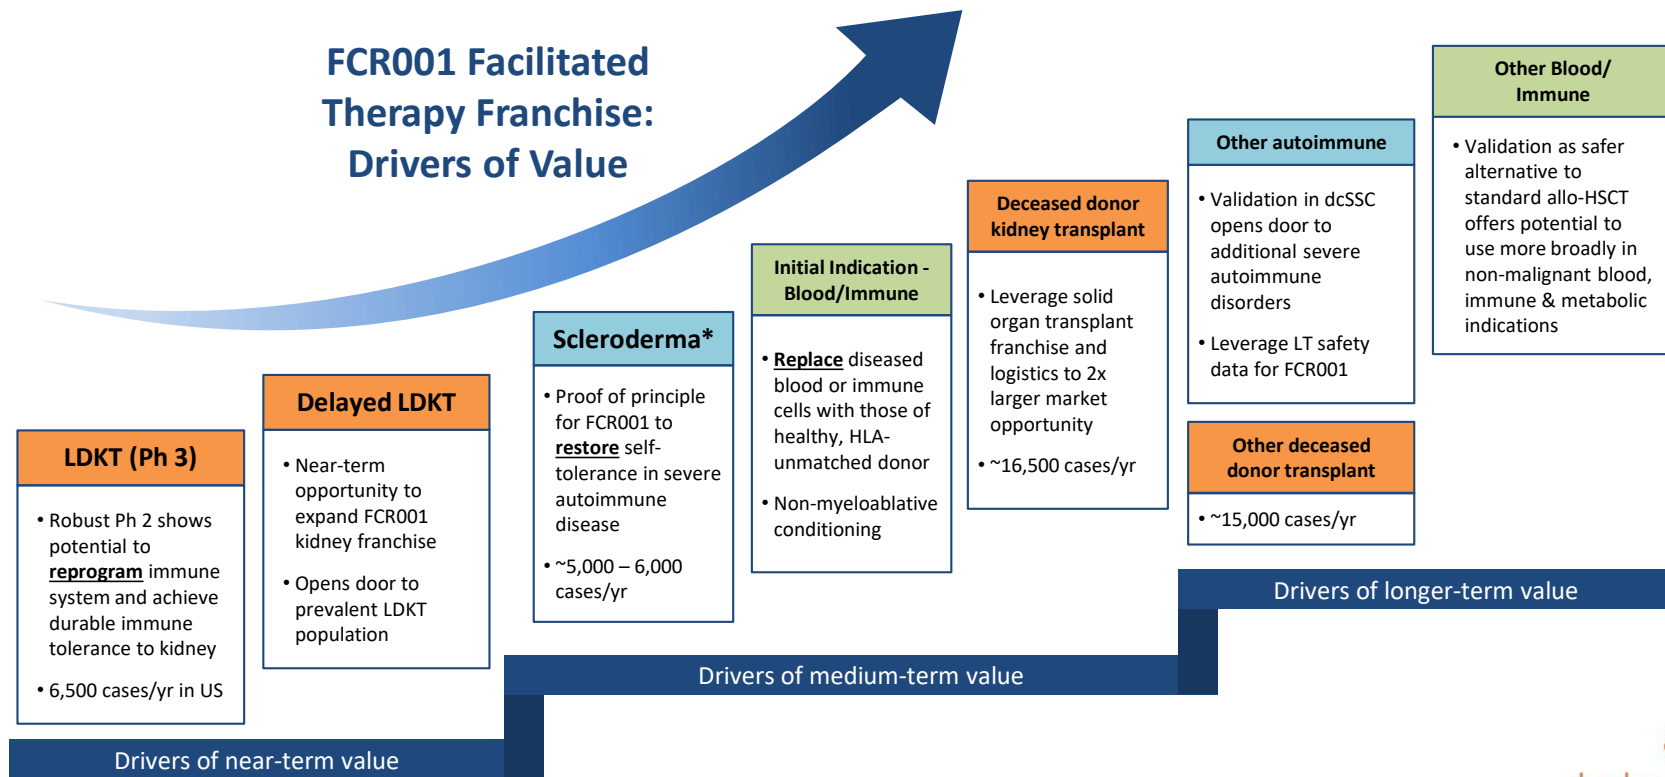

FREEDOM.4

- Active research program to establish feasibility of extracting same cells directly from deceased donor bone marrow
- Relationships established with KODA and other OPOs
- Product would be administered a few months after organ transplant

Potential US Market Opportunity
~16,500 / yr

Path to Significant Value Creation

FCR001 Facilitated Therapy Franchise: Drivers of Value

Questions?

Backup Slides

FCR001: A Modified, Allogeneic HSC-based Therapy

Proprietary composition of donor's CD34+ cells, Facilitating cells and $\alpha\beta$ T-cells

Potential to:

- ✓ Promote stem cell engraftment in unmatched recipients
- ✓ Prevent GvHD in mouse models
- ✓ Induce antigen-specific T_{reg}
- ✓ Induce B_{reg}

- FCR001 is administered with **non-myeloablative conditioning**, at doses and using protocols optimized over two decades of study
- Broad, issued composition of matter patents

Kidney Function Over Time from Ph 2 Patients

Mean Estimated eGFR* Over Time Post- Transplant

* Standard of care = retrospective analysis by Dr. J Leventhal of transplanted SoC patients at same site between 2009-2012, who met Ph 2 eligibility criteria

Facilitating Cell Mechanism of Action

Induces IL-10+ B_{reg} *in vitro*

Unmet Need in Organ Transplant: Challenges of Chronic Immunosuppression

“Ideally you want to avoid getting sick or being around sick people because your immune system is suppressed. Unfortunately, in the world we live in, you’re going to get sick. The first couple of times I got sick, I was terrified.”

- Male living donor kidney recipient in 40’s

“While others might breeze out the door in the morning, I am already preoccupied with preventing rejection, infection, and cancer.”

- FDA Voice of the Patient Panelist

- **Immunosuppression is not disease-modifying; requires lifelong chronic immunosuppression**
- **Kidney toxicity**
 - ~35% of living donor transplants and ~50% of deceased donor transplants fail within 10 years¹
- **Significantly increased risk of cancer²**
- **Hypertension, diabetes, high cholesterol, weight gain³**
 - Cardiovascular (CV) issues are leading cause of post-transplant mortality
- **Increased risk of serious infection⁴**
- **High cost, pill burden (>20 pills/day for life) and decreased QoL**
 - Cost ~\$25K in first year and \$5K-\$10K annually for life of organ¹
 - Poor compliance can lead to rejection or organ loss
 - Sleep disturbance, CNS issues, depression, and other AEs affecting QoL

Durable Immune Tolerance: The “Holy Grail” of Transplant

TRANSPLANTATION

The Quest for Transplantation Tolerance: Have We Finally Sipped from the Cup?

James F. Markmann and Tatsuo Kawai*

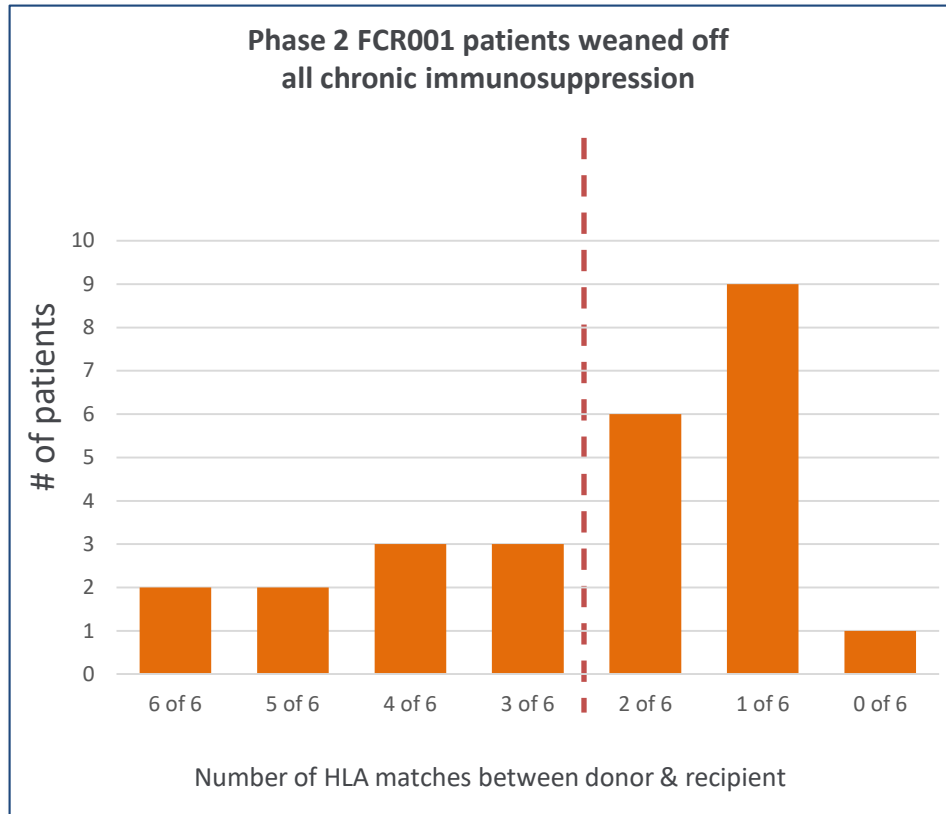

New advances in achieving hematopoietic chimerism may facilitate immunological tolerance to kidney transplants.

www.ScienceTranslationalMedicine.org 7 March 2012 Vol 4 Issue 124 124fs5

If the Leventhal *et al.* results are sustained and expanded in number, they may potentially have an enormous, paradigm-shifting impact on solid-organ transplantation.

In 1953, Billingham *et al.* reported the Nobel Prize-winning finding that neonatal inoculation of mice with allogeneic lymphoid cells could induce long-lived donor hematopoietic chimerism and that the resulting intermingling of donor and host immune cells throughout the host yielded immunological tolerance to donor-strain grafts (1). This discovery brought with it the promise of organ transplantation without the morbidity of lifelong immunosuppression and set routine attainment of immunological tolerance as the field's seemingly unreachable Holy Grail. Now, Leventhal *et al.* (2) add to advances in the last few years that suggest that the 6-decade-long quest for tolerance for kidney transplant patients may finally be nearing its end.

Robust Results Across All Degrees of HLA-Mismatch

- 19/26 (73%) durably off all chronic immunosuppression had HLA match of 3 or less between LDKT donor & recipient
- Comparable kidney and patient survival for all FCR001 vs standard of care (SoC) LDKT patients
- FCR001 safety & tolerability generally consistent with separate SoC kidney transplant + allogeneic HSCT with non-myeloablative conditioning
- Only 2 instances of GvHD despite very high degrees of HLA-mismatch
 - Phase 3 protocol modified to mitigate this risk
- No acute rejection or donor-specific antibodies in FCR001 patients off immunosuppression

Evidence of Potential Longer-Term Clinical Benefit

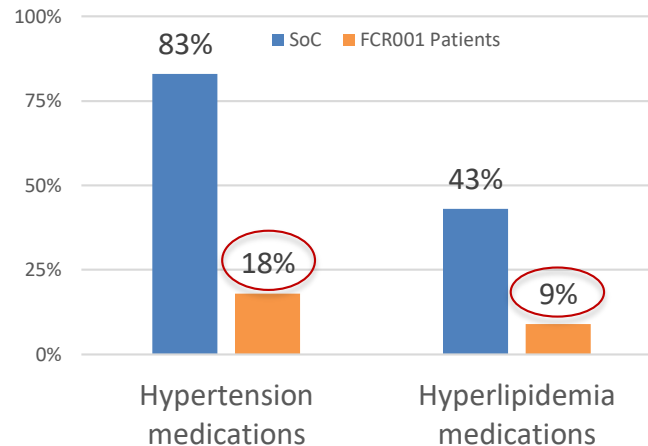

FCR001 improved Quality of Life⁽¹⁾, preserved kidney function and enabled lower reliance on cardiovascular medications⁽²⁾⁽³⁾

Mean Estimated eGFR* Over Time Post-Transplant

| | Month 1 | Year 1 | Year 2 | Year 3 | Year 4 | Year 5 |
|-------------------------|---------|--------|--------|--------|--------|--------|
| ITT population | n=37 | n=33 | n=30 | n=30 | n=25 | n=20 |
| Chimeric off chronic IS | n=26 | n=26 | n=24 | n=24 | n=20 | n=16 |
| Standard of Care | | n=147 | n=128 | n=104 | n=71 | |

Cardiovascular Medication Usage SoC vs Durably Chimeric FCR001 Patients

1. Results presented at ATC 2019 by Dr. D. Tollerud, based on cardiac and renal dysfunction measures under ESRD-SCL-TM and general health as measured by SF-36
2. Retrospective analysis by Dr. J Leventhal of transplanted SoC patients at same site between 2009-2012, who met Ph 2 eligibility criteria (n=132)
3. FCR001 patients off all chronic immunosuppression (n=26)

HLA Matching and Relatedness – Patient Status

Data as of January 31, 2021

LRD = Living Related Donor (n=20)
LURD = Living Unrelated Donor (n=17)
IS = Chronic Immunosuppression

Overview of Living Donor Kidney Transplant (U.S.)

Incidence

US De Novo LDKT Trends

- Since 2000, average 6,080 cases/year
- 2019 highest volume on record: 6,867
- ~30% of total kidney transplants annually

Sources: UNOS/OPTN 2019; USRDS 2020 Annual Data Report

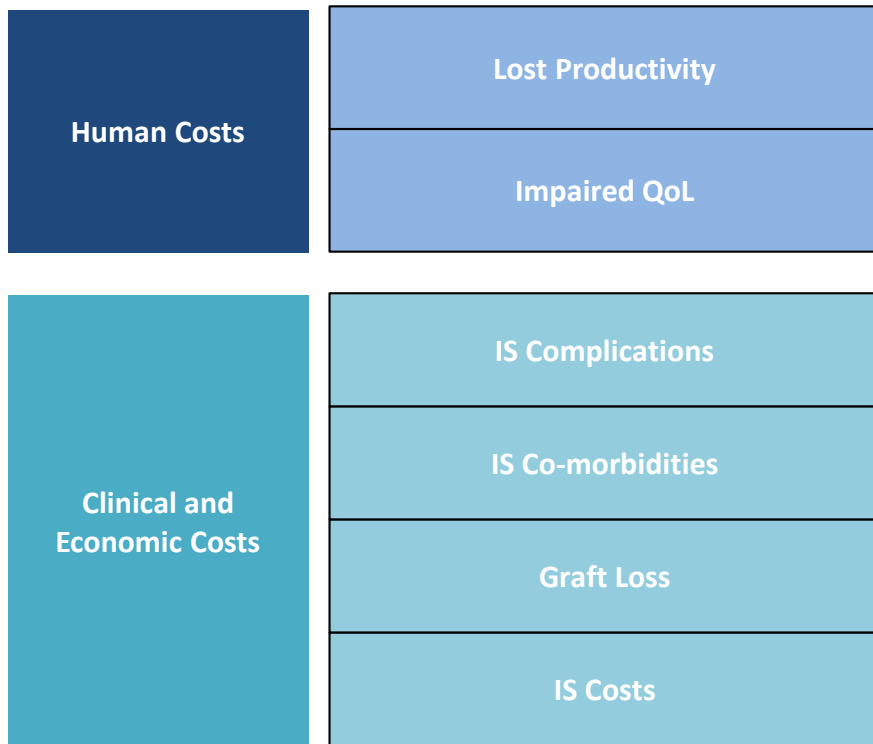

Prognosis and Prevalence

| Yr. Post LDKT | Graft Survival | Patient Survival |
|---------------|----------------|------------------|
| 1 year | 97% | 99% |
| 5 year | 85% | 94% |
| 10 year | 65% | 79% |

- Excellent short-term outcomes with LDKT
- Unmet need for improved long-term outcomes
- ~50K prevalent LDKT patients with functioning graft transplanted in past decade

Value Proposition for “One Transplant for Life”

Dimensions of Current Potential Burden of Chronic IS

Value From Eliminating Chronic IS

- Improve outcomes
 - Fewer rejections, graft losses
 - No IS co-morbidities or complications
 - Enhance patient’s QoL and freedom
- Reduce systematic costs
 - IS and meds to manage co-morbidities
 - Avoid return to dialysis or 2nd transplant
 - Bolster recipients’ productivity

Well Controlled, In-House Manufacturing Process

- Robust, reproducible process (< 24 hours)
 - No viral vectors, no genetic engineering, no cell expansion
- All manufacturing & key analytical work in-house
 - cGMP cleanroom facility
 - Capacity to supply all currently anticipated clinical needs
- No critical manufacturing processes or controls were changed between Phase 2 and Phase 3
- **Same process used for FCR001 across all indications (except deceased donor)**

Multiple Barriers to Entry

IP & reference product exclusivity potential

- Issued composition of matter patents through 2029
- Pending applications directed at certain release assays would run to 2038
- Potential for 12 years biologics data exclusivity in US
- Potential for Orphan drug exclusivity
- Substantial know-how & trade secrets associated with manufacturing process

Substantial first mover advantage

- Since durability off immunosuppression is the key goal, we have first mover advantage compared to third parties seeking to demonstrate comparable results
- Talaris' FCR001 could define a new standard of care for tolerance induction
- Safety database can be leveraged across multiple indications
